# ROC-AUC Adversarial Validation

Источники Data Drift

ROC-AUC = 1.0000

Источники Data Drift

ROC-AUC = 0.9309

# Feature Engineering

- $\text{Families\_per\_competitor} = \text{HuffFamilies} / (\text{Total\_Rank} + 1)$
- $\text{Attraction\_per\_square} = \text{Patch\_Score} / (\text{Trade\_Square} + 1\text{e-}6)$
- $\text{Families\_x\_24h} = \text{HuffFamilies} * \text{Entire\_Day}$
- $\text{Traffic\_x\_24h} = \text{Routes\_Cnt} * \text{Entire\_Day}$
- $\text{Families\_x\_attraction} = \text{HuffFamilies} * \text{Patch\_Score}$

Модель

CatBoost with Quantile loss function

Features weights

Seed ensemble

# Оптимизация весов признаков

# Ансамблирование с разным seed

Model Performance Comparison

# Интерпретация

# Альтернативные подходы

1. Кластеризация (PCA, HDBSCAN)
2. Линейные модели
3. Удаление признаков, вызывающих дрифт
4. Использование других функций потерь
5. Агрегатные признаки
6. Блендинг

Спасибо за внимание

# Приложения

# Корреляции

Разрез данных сделан по возрасту магазина

# 01 selective bias location quality

## 02 competition and cannibalization

## 05 rent and monetization pressure

### 03 store format strategy

CatBoost не продолжает возрастной тренд на новые магазины
